In 4F we have been playing a dice game. We had three dice to roll and had to make an equation that equalled from one to fifteen and you could only put one equation for each number using addition, subtraction, multiplication and division. At first it was pretty easy but once you got near the end of the game it got a lot harder because you weren’t allowed to do the same number twice. There were some really hard equations and there were only two that we could make by adding positive numbers to negative numbers. Evan and Sammy A
